output of the light bulb is 100 watts using the equation $i = p/v$ we can calculate how much current in amps would be required to get 100 watts out of this 6 volt bulb you know that $p = 100 \text{ w}$ and $v = 6 \text{ v}$ so you can rearrange the equation to solve for i and substitute in the numbers $i = 100 \text{ w} / 6 \text{ v} = 16.67 \text{ amps}$ web 9 mar 2023 the ampere regularly used connected to the inverting input as shown in the figure below $v_{cc} = 15 \text{ volt}$ $v_{cc} = 15 \text{ volt}$ web an op amp has two inputs inverting terminal labeled and non inverting terminal labeled and has a single output the first input is called inverting because the output voltage is inverse of the voltage applied at inverting input times the gain of the amplifier circuit if we apply the signal to the non inverting input we get the same signal on the output times gain web 31 oct 2012 the short answer yes that's what an op amp or any other amplifier does how it does it is the magic
